TIMING PULLEYS

FOR SYNCHRONOUS DRIVES

Toothed belts and pulleys are of major importance in synchronous drives based on flexible components.

These components enable problems to be overcome efficiently and very economically, problems that would otherwise require the use of kinematic motion gearing or transmissions with articulated link chains.

In fact, the performance provided by synchronous belt drives is analogous to the characteristic performance of both chains and gearing however belts and pulleys by comparison have additional advantages deriving from their structural features.

This evident versatility in application is essentially due to the operating characteristics that are common to all toothed belt synchronous drives, and they can be summarised as follows:

- Transmission of absolute asynchronous motion due to the complete absence of slipping.
- Regular and constant motion, since the toothed belt is free from polygonal winding and the consequent speed variation typical of chain transmissions.
- Non-extendable belt that transmits the motion without significant stretching and therefore without lost motion.
- Moderate assembly pre-tension, since adhesion is not required between the belt and the pulley.
- Minimum radial load on the shafts and on the bearings.
- High capacity to transmit power and high torques at low speed.
- Silent running, good performance, minimum overall dimensions and limited maintenance requirements.

The quality of synchronous transmission depends to an equal extent on the characteristics of both the belt and the pulley, which therefore must comply with demanding design and construction criteria.

CHIARAVALLI GROUP SpA avails of the technical collaboration of the most qualified manufacturers of belts worldwide and produces the Company's complete range of toothed pulleys in compliance with current Standards, but implementing a series of adjustments designed to improve the matching characteristics with the belt.

DIMENSIONAL FEATURES

SYMBOLS

P = Pitch
Z = N° of teeth
 $\varnothing p$ = Pulley pitch line
 $\varnothing e$ = External diameter
Lp = Pulley width
Lc = Belt width
Lpc = Belt pitch line length

16 - AT10 - 440

16 = Belt width in mm.
AT10 = Toothing pitch in mm.
440 = Pitch line length in mm.

B
Steel reinforcing

A
Polyurethane belt body

N.B.

The "AT" profile represents an optimised version of the 'T' metric pitch, ensures enhanced belt meshing with subsequent reduced noise levels, the power transmitted is greater than ~ 30% compared with the 'T' version.

FIELDS OF APPLICATION:

machine tools, electrical household appliances, textile machines, packing machines, typewriters, sewing machines, etc.
